T2.4.2

Let f be a Möbius transformation.

Then f consists of a **finite composition** of translations, rotations, dilations and inversions **iff**:

$$f(\infty) \neq \infty$$

i.e. f does not fix the point at infinity.

C2.4.3

If f is a Möbius transformation then it maps circlines to circlines.

L2.5.1

Let f be a Möbius transformation and let $z_2, z_3, z_4 \in \widetilde{\mathbb{C}}$ be distinct points such that $f(z_2) = z_2, f(z_3) = z_3$ and $f(z_4) = z_4$.

Then f(z) = z. (identity transformation)

T2.5.2

Given distinct points $z_2, z_3, z_4 \in \mathbb{C}$ there exists a unique Möbius transformation f:

$$f(z_2) = 1$$
, $f(z_3) = 0$ and $f(z_4) = \infty$.

Explicitly this mapping is given by:

$$f(z) = \frac{z_2 - z_4}{z_2 - z_3} \frac{z - z_3}{z - z_4}.$$

C2.5.3

Let $z_2, z_3, z_4, w_2, w_3, w_4 \in \widetilde{\mathbb{C}}$ be distinct points. Then there is a unique Möbius transformation f such that:

$$f(z_2) = w_3$$
, $f(z_3) = w_3$ and $f(z_4) = w_4$.

D2.5.4: Cross ratios

Let $z_1, z_2, z_3, z_4 \in \widetilde{\mathbb{C}}$ be distinct points and let f be a Möbius transformation that maps $(z_2, z_3, z_4) \mapsto (1, 0, \infty)$.

Then the **cross ratio** is defined as:

$$[z_1, z_2, z_3, z_4] := f(z_1).$$

T2.5.6

Let $z_1, z_2, z_3, z_4 \in \widetilde{\mathbb{C}}$ be distinct and let f be a Möbius transformation. Then:

$$[f(z_1), f(z_2), f(z_3), f(z_4)] = [z_1, z_2, z_3, z_4].$$
